

Every good lot deserves a buyer

Public rehearsal: secondcrate.web.app

A cancelled order can become a useful conversation.

SecondCrate helps a depot offer released stock to existing buyers, interpret conditional replies and confirm only orders that fit its price, inventory and delivery rules. Customers can stay in their connected messaging channel.

The recovery workflow

- 01 Release a known lot**
The operator reviews the cancellation and confirms the stock is available.
- 02 Find eligible buyers**
Check consent, preferences, capacity and the delivery window.
- 03 Interpret the reply**
AI proposes quantity, price and timing. Application rules authorise the order.
- 04 Commit and reconcile**
A conditional update protects stock. Orders, messages and audit events stay linked.

ILLUSTRATIVE ORDER

£708

booked sales

£480

book cost

£228

spread

40 crates / 200 kg allocated
Before handling, transport and software

The proposed commercial offer

£299 per depot per month. At £5 contribution per additional crate, 60 additional crates cover the subscription. A paid pilot must establish incremental results against the current process.

Synthetic Northstar Produce scenario. No customer traction, collected revenue or measured avoided waste is claimed.

Intended AWS architecture

Public preview: Firebase Hosting, Cloud Run and Firestore

The public rehearsal at secondcrate.web.app persists state in a dedicated Firestore database. The AWS design below is implemented in CDK but is not deployed. Live Bedrock inference and CDS messaging verification remain pending.

Integrity under real messaging conditions

Price and capacity rules run before an order commits. DynamoDB snapshot chunks and a transactional compare-and-swap head preserve shared inventory. Event IDs protect against inbound replay. Failed and unknown delivery outcomes remain visible.

Operational limits

AWS provider routing targets one live workspace.
 Workspace snapshots have a 2 MB limit. Human stock release does not certify food safety.

Next validation

Resolve AWS service access, deploy and verify Bedrock and SES. Then run paid depot pilots with measured baselines.
