

Three-minute narration

Created by Shivam Gupta / 361 words / Rehearsal cut

Read only the body paragraphs. This script uses the current rehearsal status. Verified AWS alternatives are in docs/VIDEO_SCRIPT.md.

- 0:00-0:18** Forty crates of tomatoes. One cancelled restaurant order. A truck that leaves soon. Who takes the stock now? This is SecondCrate, created by Shivam Gupta. It helps produce wholesalers turn cancelled orders into confirmed sales through the buyers they already know.
- 0:18-0:40** This is Northstar Produce, our fictional demonstration wholesaler. I paste the cancellation and review the lot: forty crates, an eighteen-pound offer and a sixteen-pound minimum. The operator confirms the stock is available and sets the dispatch and delivery times. The delivery promise stays visible throughout the workflow.
- 0:40-1:00** SecondCrate checks which buyers fit the product, have permission to receive offers and can take the stock. It prepares their conversations across the configured channels. Every conversation shares the same inventory. Buyers do not need another app.
- 1:00-1:28** Maya asks for twelve crates at seventeen pounds, provided delivery is before two. The agent interprets the request; application rules check the price, quantity, capacity and delivery window. The order is confirmed. Here is a fourteen-pound request that was rejected. The agent cannot negotiate away the minimum.

Three-minute narration

Created by Shivam Gupta / 361 words / Rehearsal cut

The financial figures describe the synthetic demonstration. Keep the actual runtime and channel status visible in the recording.

- 1:28-1:51** Ben takes twenty crates at eighteen pounds. Eight remain. Now watch two buyers claim those final eight at the same time. This button sends two concurrent requests to the server. One succeeds. The other sees the remaining availability. Forty crates never become forty-eight promises. Refresh the page, and that result is still there.
- 1:51-2:13** The ledger now shows three orders: forty crates, two hundred kilograms allocated and seven hundred and eight pounds in booked sales. Subtract four hundred and eighty pounds in book cost, and the spread is two hundred and twenty-eight pounds, before handling, delivery and software.
- 2:13-2:37** This recording uses the isolated rehearsal. Messages are simulated, and the application says so. The inventory decisions run against the server and persist after refresh. AWS integrations are implemented, but account activation is still blocking AWS deployment and live service verification. This preview makes that boundary visible.
- 2:37-3:00** The proposed price is two hundred and ninety-nine pounds per depot each month. At five pounds contribution per additional crate, sixty extra crates cover it. Paid pilots will test those assumptions. SecondCrate gives good stock another buyer, and the depot a promise it can keep.
