

Every good lot deserves a buyer

A product brief for regional produce distributors

A cancelled order can become a useful conversation.

SecondCrate helps a depot offer released stock to existing buyers, interpret conditional replies and confirm only orders that fit its price, inventory and delivery rules. Customers can stay in their connected messaging channel.

The recovery workflow

- 01

Release a known lot

The operator reviews the cancellation and confirms the stock is available.
- 02

Find eligible buyers

Check consent, preferences, capacity and the delivery window.
- 03

Interpret the reply

AI proposes quantity, price and timing. Application rules authorise the order.
- 04

Commit and reconcile

A conditional update protects stock. Orders, messages and audit events stay linked.

The proposed commercial offer

£299 per depot per month. At £5 contribution per additional crate, 60 additional crates cover the subscription. A paid pilot must establish incremental results against the current process.

Synthetic Northstar Produce scenario. No customer traction, collected revenue or measured avoided waste is claimed.

Transaction integrity on AWS

Deployable architecture. Cloud validation pending.

Authenticated workspaces separate operators. A constrained Bedrock result proposes an intent, then deterministic checks decide whether the request can commit stock. The model cannot override those checks.

Integrity under real messaging conditions

Price and capacity rules run before an order commits. DynamoDB snapshot chunks and a transactional compare-and-swap head preserve shared inventory. Event IDs protect against inbound replay. Failed and unknown delivery outcomes remain visible.

Operational limits

One configured live workspace receives provider events. Workspace snapshots have a 2 MB limit. Human stock release does not certify food safety.

Next validation

Deploy to AWS, verify Bedrock and SES, connect additional approved channels, then run paid depot pilots with measured baselines.
