

Three-minute narration

Shivam Gupta / 344 spoken words / Read the body paragraphs only

This release script requires verified live Bedrock and SES evidence. The development-preview replacement is in docs/VIDEO_SCRIPT.md.

- 0:00-0:18** I'm Shivam Gupta, and this is SecondCrate: a second destination for cancelled wholesale orders. Imagine a London restaurant cancels forty crates of cherry tomatoes. The stock is ready. The truck leaves soon. Who takes it now?
- 0:18-0:40** This is Northstar Produce, our fictional demonstration wholesaler. I paste the cancellation, review forty crates, and set an eighteen-pound offer with a sixteen-pound floor. The operator confirms the stock can be released. This clock is a dispatch cutoff, never an AI food-safety decision.
- 0:40-1:00** SecondCrate checks the existing buyer list: product preferences, permission to contact, capacity, and delivery constraints. It prepares suitable offers across the connected channels. The customer stays in their conversation; the coordinator sees one shared inventory ledger.
- 1:00-1:28** Maya replies: twelve crates at seventeen pounds, if delivery is before two. The agent interprets the conditions, then the application checks them. Seventeen is above the floor, twelve fits her capacity, and delivery fits the plan. The order is confirmed. A below-floor request is blocked, with the reason visible.

Three-minute narration

The financial figures describe the synthetic demonstration. Keep the actual runtime and channel status visible in the recording.

- 1:28-1:51** Ben takes twenty crates at eighteen pounds. Eight remain. Now two buyers claim those final eight at the same time. This replay sends concurrent requests. Only one order succeeds. The second buyer gets the actual remaining availability. No double sale, even when replies arrive together.
- 1:51-2:13** Here is the order ledger: forty crates, two hundred kilograms allocated, and seven hundred and eight pounds in booked sales. That is not profit or cash collected. The book-cost spread is two hundred and twenty-eight pounds, before handling, delivery and software.
- 2:13-2:37** The AWS evidence is here: Bedrock interprets a request, and Amazon SES returns a provider message identifier for an order confirmation. The receipt shows the actual result. Simulated channels remain labelled. A provider accepting a message is distinct from the customer receiving it.
- 2:37-3:00** SecondCrate's proposed price is two hundred and ninety-nine pounds per depot each month. At five pounds contribution per additional crate, sixty additional crates cover it. Those are assumptions to validate with paid pilots, not claimed traction. SecondCrate turns a cancelled order into a conversation that can commit the right next order.
